

MAXIMIZE PRODUCTION AND MINIMIZE RISK

Rock in stacked plays can be up to thousands of feet thick, making it difficult to resolve reported production by zone with any specificity. Selecting the wrong zone in which to drill a horizontal well could cost millions of dollars. **How can you manage this risk and maximize production?**

IDENTIFY PRODUCTION BY ZONE WITH DI TRANSFORM

Leverage dynamic data with a built-in geologic framework

Track where a specific wellbore landed

Identify the best-producing reservoir zones

Quantify average production for each zone

Make confident acquisition and drilling decisions faster and easier

DRILL SMARTER HORIZONTAL WELLS WITH DRILLINGINFO
